2.2 Audience

This document is intended for the following:

- Potential users
- System integrators of medical equipment

It is assumed that the reader is familiar with the DICOM standard.

2.3 Remarks

DICOM, by itself, does not guarantee interoperability. However, the Conformance Statement facilitates a first level validation for interoperability between different applications supporting the same DICOM functionality.

This Conformance Statement is not intended to replace validation with other DICOM equipment to ensure proper exchange of information intended.

The scope of this Conformance Statement is to facilitate communication with other vendors’ medical equipment. The Conformance Statement should be read and understood in conjunction with the DICOM Standard. However, by itself it is not guaranteed to ensure the desired interoperability and successful interconnectivity with existing DICOM systems.

The user should be aware of the following important issues:

- Test procedures should be defined to validate the desired level of connectivity.
- The DICOM standard will evolve to meet the users’ future requirements.

2.4 Definitions and Terms

Informal definitions are provided for the following terms used in this Conformance Statement. The DICOM Standard is the authoritative source for formal definitions of these terms.

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Abstract Syntax</td>
<td>The information agreed to be exchanged between applications, generally equivalent to a Service/Object Pair (SOP) Class. Examples: Verification SOP Class, Modality Worklist Information Model Find SOP Class, Ophthalmic Photography 8 Bit Image Storage SOP Class.</td>
</tr>
<tr>
<td>Application Context</td>
<td>The specification of the type of communication used between Application Entities. Example: DICOM network protocol.</td>
</tr>
<tr>
<td>Application Entity (AE)</td>
<td>An end point of a DICOM information exchange, including the DICOM network or media interface software; i.e., the software that sends or receives DICOM information objects or messages.</td>
</tr>
<tr>
<td>Application Entity Title</td>
<td>The externally known name of an Application Entity, used to identify a DICOM application to other DICOM applications on the network.</td>
</tr>
<tr>
<td>Association</td>
<td>A network communication channel set up between Application Entities.</td>
</tr>
<tr>
<td>Attribute</td>
<td>A unit of information in an object definition; a data element identified by a tag. The information may be a complex data structure (Sequence), itself composed of lower level data elements. Examples: Patient ID (0010,0020), Accession Number (0008,0050), Photometric Interpretation (0028,0004), Procedure Code Sequence (0008,1032).</td>
</tr>
</tbody>
</table>
Information Object Definition (IOD) The specified set of Attributes that comprise a type of data object; does not represent a specific instance of the data object, but rather a class of similar data objects that have the same properties. The Attributes may be specified as Mandatory (Type 1), Required but possibly unknown (Type 2), or Optional (Type 3), and there may be conditions associated with the use of an Attribute (Types 1C and 2C). Examples: MR Image IOD, CT Image IOD, Print Job IOD.

Module A set of Attributes within an Information Object Definition that are logically related to each other. Example: Patient Module includes Patient Name, Patient ID, Patient Birth Date, and Patient Sex.

Negotiation First phase of Association establishment that allows Application Entities to agree on the types of data to be exchanged and how that data will be encoded.

Presentation Context The set of DICOM network services used over an Association, as negotiated between Application Entities; includes Abstract Syntaxes and Transfer Syntaxes.

Protocol Data Unit (PDU) A packet (piece) of a DICOM message sent across the network. Devices must specify the maximum size packet they can receive for DICOM messages.

Query Key A input value for a query process. Query Keys denote the set of DICOM tags that are sent from the SCU to SCP and thus control the query result.

Service Class Provider (SCP) Role of an Application Entity that provides a DICOM network service; typically, a server that performs operations requested by another Application Entity (Service Class User). Examples: Picture Archiving and Communication System (image storage SCP, and image query/retrieve SCP), Radiology Information System (modality worklist SCP).

Service Class User (SCU) Role of an Application Entity that uses a DICOM network service; typically, a client. Examples: imaging modality (image storage SCU, and modality worklist SCU), imaging workstation (image query/retrieve SCU)

Service/Object Pair (SOP) Class The specification of the network or media transfer (service) of a particular type of data (object); the fundamental unit of DICOM interoperability specification. Examples: Ultrasound Image Storage Service, Basic Grayscale Print Management.

Service/Object Pair (SOP) Instance An information object; a specific occurrence of information exchanged in a SOP Class. Examples: a specific x-ray image.

Tag A 32-bit identifier for a data element, represented as a pair of four-digit hexadecimal numbers, the “group” and the “element”. If the “group” number is odd, the tag is for a private (manufacturer-specific) data element. Examples: (0010,0020) [Patient ID], (07FE,0010) [Pixel Data], (0019,0210) [private data element]

Transfer Syntax The encoding used for exchange of DICOM information objects and messages. Examples: JPEG compressed (images), little endian explicit value representation.

Unique Identifier (UID) A globally unique “dotted decimal” string that identifies a specific object or a class of objects; an ISO-8824 Object Identifier. Examples: Study Instance UID, SOP Class UID, SOP Instance UID.

Value Representation (VR) The format type of an individual DICOM data element, such as text, an integer, a person’s name, or a code. DICOM information objects can be transmitted with either explicit identification of the type of each data element (Explicit VR), or without explicit identification (Implicit VR); with Implicit VR, the receiving application must use a DICOM data dictionary to look up the format of each data element.

2.5 Abbreviations

The following acronyms are used in this document.

- AE — Application Entity
- AET — Application Entity Title
- DICOM — Digital Imaging and Communication in Medicine
- DIMSE — DICOM Message Service Element
- ILE — Implicit VR Little Endian
- ISO — International Standards Organization
- LUT — Look-up Table
- MWL — Modality Worklist
• NEMA — National Electrical Manufacturers Association
• PDU — Protocol Data Unit
• SCP — Storage Class Provider
• SCU — Storage Class User
• SOP — Service Object Pair
• TCP/IP — Transmission Control Protocol/Internet Protocol
• TLS — Transport Layer Security
• UID — Unique Identifier
• VR — Value Representation

3.1 Implementation Model

3.1.1 Implementation Data Flow

![Data Flow Diagram]

Figure 1. Data Flow Diagram

3.1.2 Functional Definition of AEs

3.1.2.1 Functional Definition of DICOM Web User Agent Application Entity

The MedDream DICOM Web User Agent Application Entity communicates to an Origin Server over HTTP/1.1 and HTTPS/1.1 using the GET method. It sends requests to a RESTful web service (Studies Web Service) and to a URI service (URI Web Service).

There are multiple uses:

1) implements a back-end for the Search function where the operator is provided with a set of studies matching the query request;

2) obtains the study metadata as a Study Metadata resource (or Study's Instances resource with relevant &includefield query parameters for a reduced metadata set);

3) fetches the Composite SOP Instance – either from URI Web Service as a DICOM Instance, or from Studies Web Service as an Instance resource if so configured;

4) stores marked Key Objects, Presentation State-based or Secondary Capture-based annotations back to the Origin Server. This, however, is an optional scenario; configuration also allows the legacy scenario where those objects are stored by the Storage Client via DIMSE.

3.1.2.2 Functional Definition of Query/Retrieve Client Application Entity

The Query/Retrieve Client AE connects at the presentation address given as a Called Application Entity Title. It will propose Associations with Presentation Context for SOP Class of the Query/Retrieve Service Classes (study root FIND, study root MOVE).

When using the Client as a back-end for the Search function, the Query/Retrieve Client AE will wait on the same Association for a C–FIND response and then release the Association. The operator is provided with a set of studies matching the query request. Likewise with background use of the Client to obtain the study metadata.

When the Client is used to order retrieval of the entire study to MedDream, it will wait for a C-FIND response, then send a C-MOVE command and upon reception of its response release the Association.

3.1.2.3 Functional Definition of Storage Client Application Entity

The MedDream Storage Client Application Entity is a STORAGE SCU. It connects to the presentation address configured as the Called Application Entity Title and establishes an Association with Presentation
Context of the Storage Service Class. Then it sends any supported DICOM Instances specified by the operator, over a Storage Request.

### 3.1.2.4 Functional Definition of Storage Server Application Entity

The MedDream Storage Server Application Entity waits for another application to connect at the presentation address configured for its Application Entity Title. When another application connects, the STORAGE SCP AE expects it to be a DICOM application.

The STORAGE SCP AE will accept Associations with Presentation Contexts for SOP Classes of the Verification, Instance Availability Notification and Storage Service Classes.

DICOM Instances received in a Storage Request are filed on the local (attached/mounted) file system. No any attributes from received Instances are stored anywhere except in file/directory names of the cache tree.

The received IAN N-CREATE messages are intended to control the in-advance processing and caching ("preparation") of DICOM Instances. If an Instance is referred together with Instance Availability attribute equal to "ONLINE", then a corresponding database job is created; upon its execution, a ready to use representation of the Instance is cached and will be presented faster to the end user. If an Instance is referred together with that attribute equal to "UNAVAILABLE", then references to it are removed from some kinds of cached data.

### 3.1.3 Sequencing of Real-World Activities

#### 3.1.3.1 Universal mode: DICOM ("QR") - HIS integration

3.2 AE Specification

3.2.1 DICOM Web User Agent Application Entity Specification

This Application Entity implements:

- Retrieve DICOM Instance transaction (WADO-URI) with a URI Service — as User Agent;

- Retrieve transaction (WADO-RS) with a Studies Service and Resources (for Study Metadata or Instance resources) — as User Agent;

- Search transaction (QIDO-RS) with a Studies Service and Resources (for All Studies or Study's Instances resources) — as User Agent;

- Store transaction (STOW-RS) with a Studies Service and Resources (for Studies or Study resources) — as User Agent.

It does not implement any related Retrieve Capabilities Transaction.

3.2.1.1 Retrieve DICOM Instance Transaction

3.2.1.1.1 Description and Sequence of Activity

In the User Agent, WADO-URI is the simplest means to fetch a DICOM file and involves configuring the wadoUriUrl setting with a base URL and optional parameters. If the dicomFileUrl setting is used instead, it must contain the entire URL with optional parameters to a WADO-URI endpoint of an Origin Server — because the flexibility of the underlying implementation also allows to set up Retrieve Instance of WADO-RS.
If the dicomCacheDirectory setting is not configured, the User Agent attempts to return a network-based data stream to MedDream; this might result in multiple downloads of the same resource over a short period of time. Otherwise, the received file is cached below this directory using a hierarchical path `<Study UID>/<Series UID>/<SOP Instance UID>.dcm` with UID values used during the request. Similarly, if such a file exists before the request, its contents are used instead. Out of date cached files are removed by a different part of MedDream dedicated to cleaning.

### 3.2.1.1.2 Media Types

When the Agent is configured via the wadoUriUrl setting, the contentType query parameter is added automatically and is always “application/dicom”.

When configured via the dicomFileUrl setting instead, then the entire URL template is provided and it should include “&contentType=application/dicom” for expected behavior of the Origin Server, if the latter doesn’t provide this media type by default.

The HTTP Accept header is “application/dicom”, too; however, if the googleCloudConfigFile setting is present, the header changes to “application/dicom; transfer-syntax="". A non-default value like “*/” can be forced via the fileAcceptHeader setting.

MedDream expects a DICOM Part 10 file. It does its own rendering and cannot utilize any rendered media types from the Origin Server.

### 3.2.1.1.3 Query Parameter Usage

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestType</td>
<td>Always “WADO”</td>
</tr>
<tr>
<td>studyUID</td>
<td>Study Instance UID</td>
</tr>
<tr>
<td>seriesUID</td>
<td>Series Instance UID</td>
</tr>
<tr>
<td>objectUID</td>
<td>SOP Instance UID</td>
</tr>
<tr>
<td>contentType</td>
<td>Always “application/dicom”</td>
</tr>
</tbody>
</table>

When the Agent is configured via the wadoUriUrl setting, the standard query parameters listed above are added automatically.

The setting wadoUriUrl can also include other parameters like transferSyntax or even non-standard parameters. They are inserted before the automatic ones, without checking for duplicates, therefore the Origin Server will likely ignore the first occurrence.

When configured via the dicomFileUrl setting instead, then the entire URL template is provided and it should include the query parameters listed above for expected behavior of the Origin Server. The template supports placeholders “{study}”, “{series}” and “{image}” for dynamic values.

### 3.2.1.1.4 Header Fields

The Accept header is always added, with the default value “application/dicom”. The fileAcceptHeader setting can override it with something more neutral, like “*/”.

There is no Authorization header by default. Conditions for adding it are evaluated in the following order:

1) If the googleCloudConfigFile setting is configured, then the User Agent attempts a Google Cloud service account authentication. However the subsequent WADO-URI is not supported by Google Cloud Healthcare; in such installations one must use the dicomFileUrl setting instead of wadoUriUrl.

2) If the azureAuthUrl setting is configured and the loginUrl is not, then the User Agent attempts the Azure cloud authentication. However the subsequent WADO-URI is not supported by Azure DICOM Service; in such installations one must use the dicomFileUrl setting instead of wadoUriUrl.

3) If the loginUrl setting is configured and azureAuthUrl is not, then a POST request to this address is sent, carrying HTML FORM parameters “login” from the username setting and “password” from the password setting, and expecting a cookie with name configured by the loginCookie setting. This cookie will be included...
in all subsequent requests to the Origin Server. When the cookie expires, the authentication request is repeated automatically.

4) If only username and password settings are not empty, then they are encoded accordingly and added to the request as Authorization: Basic <encoded credentials>.

5) Otherwise, the Origin Server must accept anonymous connections.

3.2.1.1.5 Supported Information Objects
During the Retrieve DICOM Instance transaction, the User Agent is able to fetch and cache objects of any IOD, with any values of SOP Class and Transfer Syntax attributes; their Part 10 streams aren’t parsed or otherwise verified during the network communication process. Support for IODs during later processing and rendering is beyond the scope of this chapter.

3.2.1.2 Retrieve Transaction
3.2.1.2.1 Description and Sequence of Activity
The User Agent uses the Retrieve transaction of WADO-RS for Study Metadata, which fetches attributes of all objects in the study at once. This is the initial part of study loading. It makes known the object UIDs for subsequent fetching of DICOM files, and prepares for different display of thumbnails according to object types detected by their other DICOM attributes.

![Diagram of Retrieve transactions in the workflow]

Figure 7. Places of the Retrieve transactions in the workflow
This transaction can also be used for the Instance resource as an alternative to WADO-URI. Retrieval of entire series or study in a single transaction (Series Instances resource, Study Instances resource) is not supported.

During retrieval of the Instance resource, if the dicomCacheDirectory setting is not configured, the User Agent attempts to return a network-based data stream to MedDream; this might result in multiple downloads of the same resource over a short period of time. Otherwise, the received file is cached below this directory using a hierarchical path `<Study UID>/<Series UID>/<SOP Instance UID>.dcm` with UID values used during the request. Similarly, if such a file exists before the request, its contents are used instead. Out of date cached files are removed not by User Agent but by a different part of MedDream dedicated to cleaning.

3.2.1.2.2 Media Types
For the Study Metadata resource, the default media type is “application/dicom+json” and the User Agent always expects a JSON stream (neither the Native DICOM Model from PS3.19, nor the encapsulation in a multipart container, are supported).

For the Instance resource, the default type is “application/dicom”, or “application/dicom; transfer-syntax=” if the setting googleCloudConfigFile is configured. The response can be either single part or multipart; the latter is detected by Content-Type response header, and the first body is always taken (regardless of part headers).

The returned Instance resource must be a DICOM Part 10 file. MedDream does its own rendering and cannot utilize any rendered media types from the Origin Server.

3.2.1.2.3 Query Parameter Usage
No query parameters are added automatically by the User Agent – neither for Study Metadata resource nor Instance resource.

The setting wadoRsUrl is a base URL that can include any query parameters (the remaining context path /studies/.../metadata is then automatically inserted, not appended). Its alternative, studyMetaUrl, is a full URL template with support for placeholders “{study}”, “{series}” and “{image}” in the context path, and can contain query parameters, too. The customer decides whether the Origin Server requires any non-standard parameters.

If the dicomFileUrl setting specifies the full URL to a WADO-RS Instance resource (../studies/{study}/series/{series}/instances/{image}), then a DICOM file is fetched via a Retrieve transaction, instead of the legacy Retrieve DICOM Instance of WADO-URI.

3.2.1.2.4 Header Fields
The Accept header is always added, with values as per Media Types chapter above. The default value for Study Metadata resource can be overridden via the metaAcceptHeader setting. The default value for Instance resource can be configured via the fileAcceptHeader setting; for example, "multipart/related; type="application/dicom" would suggest the Origin Server to use a multipart container.

There is no Authorization header by default. Conditions for adding it are evaluated in the following order:

1) If the googleCloudConfigFile setting is configured, then the User Agent performs a Google Cloud service account authentication via a third-party library "google-auth-library-oauth2-http". The obtained token is included in all subsequent requests to the Origin Server as Authorization: Bearer <token>.

2) If the azureAuthUrl setting is configured and the loginUrl is not, then the User Agent performs the Azure cloud authentication. A GET (not POST) request is sent to azureAuthUrl, carrying HTML FORM parameters in the Body: “client_id” from the username setting, “client_secret” from the password setting, hardcoded values of "grant_type" and "resource". A JSON response is expected with fields "token_type" (equal to "Bearer"), "expires_in" and "access_token". The latter will be included in all subsequent requests to the Origin Server in form of Authorization: Bearer <token>. When the token expires, the authentication request is repeated automatically.

3) If the loginUrl setting is configured and azureAuthUrl is not, then a POST request to this address is sent, carrying HTML FORM parameters "login" from the username setting and "password" from the password setting, and expecting a cookie with name configured by the loginCookie setting. This cookie will be included
in all subsequent requests to the Origin Server. When the cookie expires, the authentication request is repeated automatically.

4) If only username and password settings are not empty, then they are encoded accordingly and added to the request as Authorization: Basic <encoded credentials>.

5) Otherwise, the Origin Server must accept anonymous connections.

### 3.2.1.2.5 Response Payload Attribute Usage

The following fields are expected in the Study Metadata resource:

- (0008,0020) Study Date
- (0008,0030) Study Time
- (0010,0010) Patient Name
- (0010,0020) Patient ID
- (0010,0030) Patient Birth Date
- (0008,0050) Accession Number
- (0008,0060) Modality
- (0008,1030) Study Description
- (0020,0010) Study ID
- (0008,0090) Referring Physician's Name
- (0020,000E) Series Instance UID
- (0008,103E) Series Description
- (0020,0011) Series Number
- (0008,0018) SOP Instance UID
- (0002,0010) Transfer Syntax UID
- (0008,0016) SOP Class UID
- (0028,0008) Number Of Frames
- (0020,0013) Instance Number
- a tag configured via sourceAeTitleTag setting (none by default)

Their absence will have consequences ranging from minor to fatal; a degree of importance of particular tags is not specified at the moment. Particularly, Series Instance UID and SOP Instance UID are crucial for subsequent fetching of a DICOM file.

### 3.2.1.2.6 Supported Information Objects

If configured to use WADO-RS Retrieve Instance for fetching of DICOM files, the User Agent is able to fetch and cache objects of any IOD, with any values of SOP Class and Transfer Syntax attributes; their Part 10 streams aren’t parsed or otherwise verified during the network communication process. Support for IODs during later processing and rendering is beyond the scope of this chapter.

### 3.2.1.3 Search Transaction

#### 3.2.1.3.1 Description and Sequence of Activity

During an interactive login session, the Search transaction (resulting in an All Studies resource) precedes any others and allows the end user to choose the study for viewing.

Multiple transactions will be executed if the configuration parameter `searchPageSize` is less than 1000, as MedDream still attempts to collect 1000 results using smaller queries.

During a HIS integration session, the Search transaction resolves an object identifier like Accession Number or Patient ID to a list of Study Instance UID values. When the identifier is already a Study Instance UID in case of the “insecure” URL integration, then the transaction at least verifies presence of the object and is important for protection against unauthorized access.

Due to a flexible implementation, the Search transaction can also be used for fetching study metadata as Study's Instances resource of QIDO-RS (an alternative to Study Metadata of WADO-RS), as this provides a chance to improve performance by requesting only relevant DICOM Attributes.
3.2.1.3.2 Media Types
The default media type is "application/dicom+json" and can be modified via the metaAcceptHeader setting.
The User Agent always expects a JSON stream; neither the Native DICOM Model from PS3.19 nor the encapsulation in a multipart container are supported.

3.2.1.3.3 Query Parameter Usage

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>limit</td>
<td>Equal to the setting searchPageSize. The default is “200” if Azure authentication is configured, and “1000” otherwise.</td>
</tr>
<tr>
<td>offset</td>
<td>If the setting searchPageSize is less than 1000, then multiple requests are made with value of &quot;offset&quot; parameter increasing</td>
</tr>
</tbody>
</table>
accordingly, until the response contains less than searchPageSize results or 1000 results in total are collected. Otherwise, this parameter is not sent.

| includefield | Multiple occurrences with possible values of 0020000D, 00080020, 00080030, 00100010, 00100020, 00100030, 00080050, 00080061, 00081030, 00200010, 00080090. Can also include hexadecimal values of settings sourceAeTitleTag and studyReceivedDateTag if those are configured. |
| 00100020 | When a Patient Name filter is entered in the Search window: its value, automatically surrounded by "*" characters. |
| 00100010 | When a Patient ID filter is entered in the Search window: its value, automatically surrounded by "*" characters. When the viewer is being opened from HIS with a Patient ID filter: the exact value of the filter. The strictSearchIsEnabled setting can force presence/absence of "*" characters in both cases. |
| 00080061 | Value of the Modality filter is in the Search window. By default, the "***" characters are not present (exact match). If the otherStrictSearchTags setting is modified and does not contain the number 524384, then the filter value is surrounded by *** (substring match). |
| 00080020 | When a Study Date filter is entered in the Search window: a two-sided or one-sided date range (depending on whether both date fields are present), delimited by a hyphen character. Format: FROM-TO, FROM-, -TO. |
| 00081030 | When a Study Description filter is entered in the Search window: its value, automatically surrounded by "*" characters. |
| 00080050 | When an Accession Number filter is entered in the Search window: its value, automatically surrounded by "*" characters. When the viewer is being opened from HIS with an Accession Number filter: the exact value of the filter. The strictSearchIsEnabled setting can force presence/absence of "*" characters in both cases. |
| 0020000D | When the viewer is opened from HIS with a Study UID filter: the exact value of the filter. (Hexadecimal value of setting sourceAeTitleTag) When sourceAeTitleTag is configured, and a Source AE Title filter is entered in the Search window: value of the filter, automatically surrounded by "*" characters. The "*" characters are not added if otherStrictSearchTags setting is modified and contains the same value as in sourceAeTitleTag. |

The query parameters listed above are added automatically when fetching an All Studies resource.

The qidoRsUrl setting is a base URL that can also include other standard parameters like fuzzymatching, or even non-standard parameters. They are inserted before the automatic ones, without checking for duplicates, therefore the Origin Server will likely ignore the first occurrence.

If the wadoRsUrl setting remains unconfigured and the studyMetaUrl setting is used instead, then the source of study metadata is not Study Metadata resource of WADO-RS but Study's Instances resource of QIDO-RS. As studyMetaUrl is a full URL template that supports the "{study}" placeholder, in this case it should contain a typical value for Study's Instances, like .../studies/{study}/instances?includefield=00080020&... No query parameters are added automatically to studyMetaUrl, the customer is responsible for the entire URL. For the minimum set of includefield values, see Response Payload Attribute Usage under Retrieve Transaction.
3.2.1.3.4 Header Fields
The Accept header is always added, with value of "application/dicom+json" (can be overridden via the metaAcceptHeader setting).

There is no Authorization header by default. Conditions for adding it are evaluated in the following order:

1) If the googleCloudConfigFile setting is configured, then the User Agent performs a Google Cloud service account authentication via a third-party library "google-auth-library-oauth2-http". The obtained token is included in all subsequent requests to the Origin Server as Authorization: Bearer <token>.

2) If the azureAuthUrl setting is configured and the loginUrl is not, then the User Agent performs the Azure cloud authentication. A GET (not POST) request is sent to azureAuthUrl, carrying HTML FORM parameters in the Body: "client_id" from the username setting, "client_secret" from the password setting, hardcoded values of "grant_type" and "resource". A JSON response is expected with fields "token_type" (equal to "Bearer"), "expires_in" and "access_token". The latter will be included in all subsequent requests to the Origin Server in form of Authorization: Bearer <token>. When the token expires, the authentication request is repeated automatically.

3) If the loginUrl setting is configured and azureAuthUrl is not, then a POST request to this address is sent, carrying HTML FORM parameters "login" from the username setting and "password" from the password setting, and expecting a cookie with name configured by the loginCookie setting. This cookie will be included in all subsequent requests to the Origin Server. When the cookie expires, the authentication request is repeated automatically.

4) If only username and password settings are not empty, then they are encoded accordingly and added to the request as Authorization: Basic <encoded credentials>.

5) Otherwise, the Origin Server must accept anonymous connections.

3.2.1.3.5 Response Payload Attribute Usage
The following fields are expected in the All Studies resource:
- (0020,000D) Study Instance UID
- (0008,0020) Study Date
- (0008,0030) Study Time
- (0010,0010) Patient Name
- (0010,0020) Patient ID
- (0010,0030) Patient Birth Date
- (0008,0050) Accession Number
- (0008,0061) Modalities In Study
- (0008,1030) Study Description
- (0020,0010) Study ID
- (0008,0090) Referring Physician's Name
- a tag configured via sourceAeTitleTag setting (none by default)
- a tag configured via studyReceivedDateTag setting (none by default)

Their absence might result in undefined behavior; a degree of importance of particular tags is not specified at the moment. At least Study Instance UID is needed for subsequent opening of the study.

For a list of fields expected in the Study's Instances resource, see Response Payload Attribute Usage under Retrieve Transaction.

3.2.1.4 Store Transaction
3.2.1.4.1 Description and Sequence of Activity
The User Agent uses the Store transaction of STOW-RS for uploading new objects (DICOM-formatted annotations) back to the Origin Server. It sends a single instance in DICOM Part 10 format.
3.2.1.4.2 Query Parameter Usage
No query parameters are added automatically by the User Agent.

A substring "/studies/{study}" is automatically added to the value of stowRsUrl and later the {study} placeholder is replaced with Study Instance UID extracted from the object being uploaded. This kind of URL instructs the Origin Server to validate the Study Instance UID attribute in the object being uploaded, although there is no benefit in doing so. In contrast, the alternative setting uploadUrl is a template for a ready to use URL; if that validation is needed due to requirements of the Origin Server, then the setting must contain the corresponding substring, and vice versa.

3.2.1.4.3 Header Fields
The Accept header is always added. The default value is "application/dicom+json" and can be overridden via the metaAcceptHeader setting.

There is no Authorization header by default. Conditions for adding it are evaluated in the following order:

1) If the googleCloudConfigFile setting is configured, then the User Agent performs a Google Cloud service account authentication via a third-party library "google-auth-library-oauth2-http". The obtained token is included in all subsequent requests to the Origin Server as Authorization: Bearer <token>.

2) If the azureAuthUrl setting is configured and the loginUrl is not, then the User Agent performs the Azure cloud authentication. A GET (not POST) request is sent to azureAuthUrl, carrying HTML FORM parameters in the Body: "client_id" from the username setting, "client_secret" from the password setting, hardcoded values of "grant_type" and "resource". A JSON response is expected with fields "token_type" (equal to "Bearer"), "expires_in" and "access_token". The latter will be included in all subsequent requests to the Origin Server in form of Authorization: Bearer <token>. When the token expires, the authentication request is repeated automatically.
3) If the loginUrl setting is configured and azureAuthUrl is not, then a POST request to this address is sent, carrying HTML FORM parameters "login" from the username setting and "password" from the password setting, and expecting a cookie with name configured by the loginCookie setting. This cookie will be included in all subsequent requests to the Origin Server. When the cookie expires, the authentication request is repeated automatically.

4) If only username and password settings are not empty, then they are encoded accordingly and added to the request as Authorization: Basic <encoded credentials>.

5) Otherwise, the Origin Server must accept anonymous connections.

3.2.1.4.4 Response Payload Attribute Usage
An HTTP Status code 200 or 204 is treated as a success indicator. Additionally, a non-empty Body must contain a valid JSON stream with a PS 3.19-formatted object structure. If it's (0008,1199) Referenced SOP Sequence > (0008,1196) Warning Reason, then the first element of the latter is logged for reference (not displayed to the end user).

3.2.2 Query/Retrieve Client Application Entity Specification

3.2.2.1 SOP Classes
Application Entity provides Standard Conformance to the following SOP Classes:

<table>
<thead>
<tr>
<th>SOP Class Name</th>
<th>SOP Class UID</th>
<th>SCU</th>
<th>SCP</th>
</tr>
</thead>
<tbody>
<tr>
<td>Study Root Query/Retrieve Information Model – FIND</td>
<td>1.2.840.10008.5.1.4.1.2.2.1</td>
<td>YES</td>
<td>NO</td>
</tr>
<tr>
<td>Study Root Query/Retrieve Information Model – MOVE</td>
<td>1.2.840.10008.5.1.4.1.2.2.2</td>
<td>YES</td>
<td>NO</td>
</tr>
</tbody>
</table>

3.2.2.2 Associations Policies

3.2.2.2.1 General
At a command from the operator, the MedDream Query/Retrieve Client AE attempts to establish an association with the specified Remote AE. When the association is established, a C-FIND request is made to retrieve a list of studies using the defined matching keys, or metadata of a study using its Study Instance UID. In the second case, after the response confirms existence of the study, an additional C-MOVE sub-request might be made to order the transfer of the entire study to the MedDream Storage Server AE. The MedDream Query/Retrieve Client waits for any C-FIND response. The established association remains active until a C-FIND response from the remote AE indicates the end of requested data items, or until a timeout period expires.

The MedDream Query/Retrieve Client AE itself does not accept Associations.

The DICOM standard application context name for DICOM 3.0 is always accepted and proposed:

| Application Context Name | 1.2.840.10008.3.1.1.1 |

3.2.2.2.2 Number of Associations
Only a single Association is active at the moment. The results are displayed to the operator only after receiving them from SCP entirely.

3.2.2.2.3 Asynchronous Nature
The Query/Retrieve Client does not support asynchronous communication (multiple outstanding transactions over a single Association).

3.2.2.2.4 Implementation Identifying Information
The implementation information for this Application Entity is:

| Implementation Class UID | 1.2.826.0.1.3680043.2.60.0.1 |
| Implementation Version Name | jdt270_6004 |

3.2.2.3 Association Initiation Policy
### 3.2.2.3.1 Activity - All interactions

#### 3.2.2.3.1.1 Description and Sequence of Activity

<table>
<thead>
<tr>
<th>Tag and Attribute Name</th>
<th>VR</th>
<th>Query key</th>
<th>Modifiable</th>
<th>Displayed in GUI</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0008,0020) Study Date</td>
<td>DA</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>(0008,0030) Study Time</td>
<td>TM</td>
<td></td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>(0008,0050) Accession Number</td>
<td>SH</td>
<td>C</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>(0008,0052) Query/Retrieve Level</td>
<td>CS</td>
<td>X</td>
<td></td>
<td></td>
</tr>
<tr>
<td>(0008,0061) Modalities In Study</td>
<td>CS</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>(0008,1030) Study Description</td>
<td>LO</td>
<td>P</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>(0010,0010) Patient's Name</td>
<td>PN</td>
<td>P</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>(0010,0020) Patient ID</td>
<td>LO</td>
<td>C</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>(0020,000D) Study Instance UID</td>
<td>UI</td>
<td>X</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The attributes listed above can be requested in a query. The corresponding matching keys are empty if the operator didn't specify a particular value; it's not possible to search for an empty value.

**Legend:**

- **X** = Always an exact match.
- **P** = Always a partial match (value is automatically enclosed by “*” characters).
- **C** = Partial match (automatically enclosed by “*” characters) when searching interactively, or exact match when used as a study identifier in HIS integration scenarios.
3.2.2.3.1.2 Proposed Presentation Contexts

### 3.2.3.2 Associations Policies

#### 3.2.3.2.1 General

The Storage Client AE proposes Association Requests for the Storage Service.

The DICOM standard application context name for DICOM 3.0 is always accepted and proposed:

<table>
<thead>
<tr>
<th>Application Context Name</th>
<th>1.2.840.10008.3.1.1.1</th>
</tr>
</thead>
</table>

#### 3.2.3.2.2 Number of Associations

Only a single Association is active at the moment. DICOM instances are sent one at a time.

#### 3.2.3.2.3 Asynchronous Nature

The Storage Client does not support asynchronous communication (multiple outstanding transactions over a single Association).

#### 3.2.3.2.4 Implementation Identifying Information

The implementation information for this Application Entity is:

<table>
<thead>
<tr>
<th>Implementation Class UID</th>
<th>1.2.826.0.1.3680043.2.60.0.1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Implementation Version Name</td>
<td>jdt270_6004</td>
</tr>
</tbody>
</table>

#### 3.2.3.3 Association Initiation Policy
3.2.3.3.1 Activity - All interactions

3.2.3.3.1.1 Description and Sequence of Activity

3.2.4.2 Associations Policies

3.2.4.2.1 General
The Storage Server AE accepts Association Requests for the Storage Service, Verification Service and Instance Availability Notification Service.

The DICOM standard application context name for DICOM 3.0 is always accepted and proposed:

<table>
<thead>
<tr>
<th>Application Context Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.2.840.10008.3.1.1.1</td>
<td>DICOM application context name for Storage Server AE</td>
</tr>
</tbody>
</table>

3.2.4.2.2 Number of Associations
The number of supported parallel associations can be adjusted, and is 5 by default. This is a socket-level limitation; any more attempts (up to 50 in parallel) to connect to the service port will wait indefinitely.

3.2.4.2.3 Asynchronous Nature
The Storage Server does not support asynchronous communication (multiple outstanding transactions over a single Association).

3.2.4.2.4 Implementation Identifying Information
The implementation information for this Application Entity is:

<table>
<thead>
<tr>
<th>Implementation Class UID</th>
<th>Implementation Version Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.2.826.0.1.3680043.2.60.0.1</td>
<td>jdt270_6004</td>
</tr>
</tbody>
</table>

3.2.4.3 Association Initiation Policy
3.2.4.3.1 Activity - All interactions
3.2.4.3.1.1 Description and Sequence of Activity
If configured, the Storage Server is always running in background, regardless of user’s actions.

It replies to Verification requests at any time.

It always listens for Storage requests. If a supported Presentation Context is offered, the corresponding Composite Object is stored below the cache directory. This can be a result of either a C-MOVE request from the Query/Retrieve Client in MedDream (which shortly afterwards finds the stored object in the cache), or a
standalone decision from the SCP to forward the object to MedDream in advance (and therefore the C-MOVE request can be avoided).

It always listens for Instance Availability Notification requests.

### 3.3 Network Interfaces

DICOM Upper Layer over TCP/IP is supported by:
- Query/Retrieve Client
- Storage Client
- Storage Server

HTTP and HTTPS are supported by:
- DICOM Web User Agent

#### 3.3.1 Physical Network Interface

MedDream is indifferent to the physical medium over which TCP/IP executes. It inherits the TCP/IP stack from the operating system.

#### 3.3.2 Additional Protocols

No additional protocols are supported.
3.3.3 IPv4 and IPv6 Support
Only IPv4 is explicitly supported and was tested.

3.4 Configuration

3.4.1 AE Title/Presentation Address Mapping

3.4.1.1 Local AE Titles

<table>
<thead>
<tr>
<th>Application Entity</th>
<th>Default AE Title</th>

Note 1: applies only to searching for studies and sending a C-MOVE command. When Query/Retrieve Client is used for collecting attributes of a study, then the default timeout value is 5 seconds and configurable.
4 Processing and rendering
4.1 SOP Classes supported for display

Known unsupported non-image Classes, like Raw Data Storage (1.2.840.10008.5.1.4.1.1.66), are used by a hardcoded filter that removes those objects from the study. Export and Forward functionalities, however, will still transfer them.

At least one example of a DICOM object referenced in the table below is used in regular tests of MedDream.

<table>

4.2 Transfer Syntaxes supported for display

When parsing the DICOM files for display purposes, MedDream expects DICOM Part 10 files — namely, with Preamble, Prefix and FileMetaInformation. If those pieces are missing, then only Implicit VR Little Endian transfer syntax is supported.

The Deflated Explicit VR Little Endian (1.2.840.10008.1.2.1.99) transfer syntax is not supported neither for visualization nor for network operations.

At least one example of a DICOM object referenced in the table below is used in regular tests of MedDream.

<table>

</tbody>
</table>
5 Media Interchange
MedDream does not support Media Interchange.
6 Support of Extended Character Sets
MedDream supports ISO_IR 192 (Unicode UTF-8) as an extended character set.
7 Security
The DICOM capabilities of MedDream contain the following security features.

The Storage Server has the mandatory "acceptAETitles" parameter that lists acceptable Remote AE Titles; it is not possible to configure association acceptance from any title. There also are optional parameters "allowedLps" for remote IP address filtering, and "address" for binding to a single particular IP address available in the system instead of all addresses.

TLS and its mutual authentication is only supported for DICOMweb transactions (not for DIMSE), and must be configured globally via JVM command-line options javax.net.ssl.trustStore / javax.net.ssl.keyStore.

It is assumed that the Software is used within a secured environment. It is assumed that a secured environment includes at a minimum:

- firewall or router protections to ensure that the Software only has network access to approved external hosts and services;
- appropriate secure network channels (e.g., such as a Virtual Private Network) for any communication with external hosts and services outside the locally secured environment.

Other network security procedures such as automated intrusion detection may be appropriate in some environments. Additional security features may be established by the local security policy and are beyond the scope of this conformance statement.
